Beschreibung

The line editing widget for Qt currently ignores the 'readOnly' property, which is supported by the combo box widget, for example. Read-only line editing widgets are often used to display dynamic and non-editable values.

The attached patches add a corresponding visual test case and the corresponding support. They are based on commit 1764d065 and were compiled without any problems in an out-of-source build. Running <build-dir>/gui/qt5/libtest shows the additional line edit widget (see right of label 'Input3') as read only field.
